**Please find below and/or attached an Office communication concerning this application or proceeding.**

The time period for reply, if any, is set in the attached communication.

### Office Action Summary

**Application No.**

10/531,733

**Applicant(s)**

NAPPER ET AL.

**Examiner**

HADI AKHAVANNIK

**Art Unit**

2624

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --  
**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 30 January 2008.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 14 and 17-27 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 14 17-27 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

**Priority under 35 U.S.C. § 119**

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

**Attachment(s)**

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO/CDC)
- 4) ☐ Interview Summary (PTO-413)
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: \_\_\_\_\_
- Paper No(s)/Mail Date \_\_\_\_\_

***Continued Examination Under 37 CFR 1.114***

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 12/26/07 has been entered.

***Response to Arguments***

2. Applicant argues that Gierhart discloses only a moving average and not the mean for all the of the sampled points. Examiner believes that a moving average could include all the sampled points if the window of the moving average was sufficient. However, to further clarify his rejection, the examiner is incorporating Schwartz (6215901), which discloses taking the average of all the sample points of a tilt.

***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. Claims 14, 17-22, 24-27 rejected under 35 U.S.C. 103(a) as being unpatentable over Ikebata (6226404) in view of Gierhart et al. (5730602, referred to as "Gierhart" herein) in further view of Schwartz (6215901).

Regarding claim 14, Ikebata discloses a method of estimating the orientation of a segment of digital ink, the method including the steps of: measuring the azimuth of the pen at a sampling rate during writer generation of the segment of digital ink (see figure 1 item 2, column 4 lines 19-28 discloses sampling rates, and column 3 lines 35-41 discloses calculating the slant angle or azimuth of the pen);

and estimating the orientation of the segment of digital ink using the measured azimuth of the pen at sampled points (by calculating the slant angle the direction of the character is also calculated as disclosed in column 4 line 59 to column 5 line 4. Also, see figures 8-9 as it discloses correcting the orientation of a segment of digital ink).

Ikebata does not explicitly disclose determining an mean azimuth or subtracting the current point from the mean azimuth.

Gierhart discloses finding the moving average azimuth (see figure 7a and column 17 lines 50-55) and subtracting the current point from the moving average (see column 17 lines 50-64, specifically lines 61-64, where variance is described).

It would have been obvious at the time of the invention to one of ordinary skill in the art to include in Ikebata the moving average azimuth calculating means as taught by Gierhart. The reason for the combination is because it makes for a more robust system that is able to calculate the difference from the current point to an average allowing the system to identify the difference between the current point and previous points.

Ikebata and Gierhart do not explicitly disclose taking the mean of all the sampled points.

Schwartz discloses finding the average tilt of all the points (see column 11 lines 1-13 which discloses finding the mean of the points).

It would have been obvious at the time of the invention to one of ordinary skill in the art to include in Ikebata and Gierhart the ability to use more sampled points to create an average as taught by Schwartz. The reason for the combination is to create a more reliable average that includes more data to better predict the slant.

Regarding claim 17, Ikebata discloses that the estimated orientation of the segment of digital ink is subsequently used in a digital ink line orientation normalization technique (column 5 lines 1-4 discloses normalizing the slant angle so as to correct the orientation. This is also shown in figures 8-9).

Regarding claim 18, Ikebata discloses that a single, fixed orientation estimation is utilised for a line of digital ink (column 4 lines 40-63 discloses that a standard slant angle may be used. This standard slant angle is computed from the training data and this will act as a fixed estimation).

Regarding claim 19, Ikebata discloses that the orientation estimation that varies across a line of digital ink is utilized (in order to modify the standard angle disclosed in the rejection of claim 3, Ikebata also discloses calculating the average slant angle. In column 4 lines 40-50 and column 6- lines 7-44 he discloses calculating the average slant pattern. Therefore, in order to calculate the orientation using the average slant angle, the system must calculate the varying angle across the digital ink).

Regarding claim 20, Ikebata discloses normalizing the estimated orientation to be within the range of 0.degree. to 360.degree (Column 5 lines 59-65 discloses a slant compensation method that normalizes the digital ink by subtracting the standard slant angle, which is the average slant angle of the user, by the current angle. Column 6 discloses that the angles are between 0 and 360).

Regarding claim 21, column 6 lines 55-59 discloses that the slant angle is can be calculated for each of the input characters. This means that that the system can function for many characters.

Regarding claim 22, the examiner notes that one character can be read to be a line segment. Therefore the rejection of claim 6 discloses all aspects of claim 7.

Regarding claim 24, Ikebata discloses that the orientation estimation uses a writer independent handwriting model (column 5 lines 30-33 discloses that the system can use data from a user group or user. The user group may include as a group of left handed or right handed people.)

Regarding claim 25, Ikebata disclose that the orientation estimation uses a writer dependent handwriting model trained using sample digital ink input by the writer (column 5 line 66 to column 6 line 6 disclose learning the users writing style to create the standard slant angle).

Regarding claim 26, the figures 8-9 disclose that a consistent baseline is used to calculate the standard angle as a character is placed back on the X axis.

Regarding claim 27, Ikebata does not disclose that the input data needs to have specific characteristics, therefore, the examiner believes that the data is arbitrary.

4. Claim 23 is rejected under 35 U.S.C. 103(a) as being unpatentable over Ikebata in view of Gierhart in view of Schwartz in further view of Parthasarathy et al. (5740273, referred to as "Parthasarathy" herein).

Regarding claim 23, Ikebata and Gierhart disclose all aspects of claim 8 except for segmenting based on azimuth values.

Parthasarathy discloses that the line segmentation is performed by measuring a change in azimuth value (see figure 1 item 110 and column 3 lines 25-35 discloses segmenting points based on angle changes).

It would have been obvious at the time of the invention to one of ordinary skill in the art to include in Ikebata and Gierhart the segmenting means as taught by Parthasarathy. The reason for the combination is because it makes for a more robust system that can find character changes by looking for extreme angle changes.

### ***Conclusion***

5. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Matsutani (7068821).

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Hadi Akhavannik whose telephone number is 571-272-8622. The examiner can normally be reached on 10:30-7:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Brian P. Werner can be reached on 517-272-7401. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
